IN THE CLAIMS

Please amend the claims as follows:

1. (Currently Amended) An implantable medical device, comprising:

a housing for containing electronic circuitry;

an antenna embedded in a dielectric compartment;

circuitry within the housing connected to the antenna for transmitting and receiving a modulated radio-frequency carrier at a specified carrier frequency; and,

an antenna tuning circuit for matching the impedance of the antenna to the transmitting/receiving circuitry at a specified carrier frequency by loading the antenna with inductance or capacitance and for converting between a single-ended signal generated or received by the transmitter/receiver circuitry and a differential signal generated or received by the antenna, wherein the antenna tuning circuit further comprises a variable tuning capacitor for adjusting the resonant frequency of the antenna.

- 2. (Original) The device of claim 1 wherein the dielectric compartment is within a header for the device having feedthroughs therein for routing connections between internal circuitry and external leads.
- 3. (Original) The device of claim 1 wherein the dielectric compartment is a dielectric pocket adjacent a surface of the device housing.
- 4. (Original) The device of claim 1 wherein the dimensions of the antenna are such that a significant portion of radio-frequency energy delivered to the antenna at the specified carrier frequency is emitted as far-field radiation.
- 5. (Original) The device of claim 1 wherein the antenna is a helically coiled antenna.

- 6. (Original) The device of claim 5 wherein the helically coiled antenna is oriented roughly parallel to a surface of the device housing and further wherein the electrical length of the antenna is approximately one-half wavelength of the specified radio-frequency carrier.
- 7. (Original) The device of claim 5 wherein the helically coiled antenna is oriented roughly perpendicular to a surface of the device housing and further wherein the electrical length of the antenna is approximately one-quarter wavelength of the specified radio-frequency carrier so as to act as a monopole antenna with the device housing serving as a ground plane.
- 8. (Cancelled)
- 9. (Cancelled)
- 10. (Currently Amended) The device of claim [[9]] 1 wherein the tuning circuit further comprises a balun transformer for converting between a single-ended signal generated or received by the transmitter/receiver circuitry and a differential signal generated or received by the antenna.
- 11. (Original) The device of claim 10 wherein a winding of the balun transformer is formed by the belical antenna.
- 12. (Original) The device of claim 1 wherein the device is a cardiac rhythm management device having rhythm control circuitry electrically connected to one or more electrodes adapted for disposition within or near the heart by one or more therapy leads.
- 13. (Original) The device of claim 12 wherein the helical antenna is embedded within a header of the device coiled around a bore into which an end of a therapy lead is inserted.

Filing Date: March 15, 2004 Title: ANTENNA FOR AN IMPLANTABLE MEDICAL DEVICE

14. (Previously Presented) A method for transmitting and receiving radio-frequency signals in an implantable medical device, comprising:

transmitting or receiving a modulated radio-frequency carrier at a specified carrier frequency to or from an antenna;

matching the impedance of the antenna to the transmitting/receiving circuitry at a specified carrier frequency by loading the antenna with inductance or capacitance using an antenna tuning circuit; and,

converting between a single-ended signal generated or received by the transmitter/receiver circuitry and a differential signal generated or received by the antenna.

- 15. (Original) The method of claim 14 further comprising converting between a single-ended signal generated or received by the transmitter/receiver circuitry and a differential signal generated or received by the antenna with a balun transformer.
- 16. (Original) The method of claim 15 further comprising adjusting the resonant frequency of the antenna to a specified carrier frequency with a variable capacitor.
- 17. (Original) The method of claim 14 wherein the antenna is a helically coiled antenna.
- 18. (Original) The method of claim 17 wherein the helically coiled antenna is oriented roughly parallel to a surface of the device housing and further comprising transmitting at a carrier frequency with a wavelength approximately twice the electrical length of the antenna.
- 19. (Original) The method of claim 17 wherein the helically coiled antenna is oriented roughly perpendicular to a surface of the device housing and further comprising transmitting at a carrier frequency with a wavelength approximately four times the electrical length of the antenna such that the antenna acts as a monopole antenna with the device housing serving as a ground plane.

20. (Original) The method of claim 17 further comprising converting between a single-ended signal generated or received by the transmitter/receiver circuitry and a differential signal generated or received by the antenna with a balun transformer and wherein one winding of the transformer is formed by the helical antenna.
